

**Amendments to the Claims:**

The following listing of claims will replace all prior versions, and listings, of claims in the application:

- 1-7. (Canceled)
8. (Currently Amended) An image-capturing device, comprising:
  - an image sensor that captures a subject image and generates image data;
  - an operation member that operates to cause the image sensor to capture a subject image and generate image data;
  - a memory; and
  - an image storage control unit that controls transfer of image data, and is operable in a communication mode, to automatically transfer image data generated by the image sensor to an external device via a communication circuit capable of communicating with the external device to store the image data in the external device, and if when communication with the external device is substantially unusable disabled, to transfer image data generated by the image sensor to the memory so that the operation member can be operated to cause the image sensor to capture a next subject image.
9. (Previously Presented) An image-capturing device according to claim 8, wherein the memory is a detachable portable memory which is loaded in the image-capturing device.
10. (Previously Presented) An image-capturing device according to claim 8, wherein the image storage control unit detects whether or not wireless communication with the external device is enabled and transfers image data generated by the image sensor to the memory if wireless communication with the external device is detected to be disabled.

11. (Previously Presented) An image-capturing device according to claim 8, wherein the image storage control unit detects whether or not a storage capacity of the external device is sufficient and transfers image data generated by the image sensor to the memory if the storage capacity of the external device is detected to be insufficient.

12. (Canceled)

13. (Currently Amended) An image-capturing device, comprising:  
an image sensor that captures a subject image and generates image data;  
a connection unit that electrically, detachably and exclusively connects to a main body of the image-capturing device either a portable memory or a wireless communication circuit capable of wirelessly communicating with an external device;  
a detection unit that detects whether or not the wireless communication circuit is connected at the connection unit; and

an image storage control unit that controls transfer of image data, to automatically and directly transfer image data generated by the image sensor to the portable memory if the portable memory is connected at the connection unit and to automatically and wirelessly transfer image data generated by the image sensor to the external device via the wireless communication circuit if the detection unit detects that the wireless communication circuit is connected at the connection unit.

14. (Canceled)

15. (Currently Amended) An electronic camera, comprising:  
an image sensor that captures a subject image and generates image data;  
an operation member that is operated to cause the image sensor to capture a subject image and generate image data;  
a memory; and

an image storage control unit that controls transfer of image data, and is operable in a communication mode, to automatically transfer image data generated by the image sensor to an external device via a wireless communication circuit to store the image data in the external device, and ~~if~~when communication with the external device is ~~substantially unusable~~disabled, to transfer image data generated by the image sensor to the memory so that the operation member can be operated to cause the image sensor to capture a next subject image.

16. (Canceled)

17. (Currently Amended) An image-capturing device according to claim 8, wherein the image storage control unit does not store image data which has been transferred to the external device in the memory.

18. (Previously Presented) An image-capturing device according to claim 8, wherein the communication circuit is a wireless communication circuit capable of communicating with the external device through a wireless communication.

19. (Previously Presented) An image-capturing device according to claim 9, wherein the detachable portable memory is a memory card.

20. (Previously Presented) An electronic camera according to claim 15, wherein the memory is a detachable portable memory which is loaded in the electronic camera.

21. (Previously Presented) An image-capturing device according to claim 8, wherein the image storage control unit further controls transfer of the image data to transfer image data stored in the memory to the external device when the external device becomes usable.

22. (Currently Amended) An image-capturing device, comprising:

- an image sensor that captures a subject image and generates image data;
- an operation member that is operated to cause the image sensor to capture a subject image and generate image data;
- a memory;
- a setting unit that sets either the memory or an external device as a storage device where image data generated by the image sensor is to be stored;
- a communication circuit capable of ~~communicating wireless~~ communication with the external device; and
- an image storage control unit that controls transfer of image data, to transfer image data generated by the image sensor to the memory in the case that the memory is set as the storage device, to transfer image data generated by the image sensor to the external device ~~via aby wireless communication via the~~ communication circuit in the case that the external device is set as the storage device, and to transfer image data generated by the image sensor to the memory in the case that the external device is set as the storage device and ~~communication with~~ the external device is ~~substantially unusable~~ disabled, so that the operation device can be operated to cause the image sensor to capture a next subject image.
